

# Lecture 4

SQL  
History, basics

# History

System/R

SEQUEL (Structured English Query Language), 1974

SEQUEL/2, 1976-1977

SQL89 → SQL1

SQL92 → SQL2

SQL99 → SQL3

SQL:2003

# SQL Types

Interactive

Internal

# Subsets SQL

DDL

DML

TCL

DCL

CCL

# DDL

Data Definition Language manages table, index structure, objects.

CREATE/DROP/ALTER TABLE

CREATE/DROP VIEW

CREATE/DROP INDEX

CREATE/DROP SCHEME

CREATE/DROP/ALTER DOMAIN

# DML

Data Manipulation Language is the subset of SQL used to add, update and delete data.

SELECT  
INSERT  
DELETE  
UPDATE

# TCL

Transaction Control Language are used to control changes that are made by DML commands.

COMMIT

ROLLBACK

SET TRANSACTION

# DCL

Data Control Language, another name is Access Control Language, are used for administrative functions, to give or to take rights/access to use database, data or to execute commands.

GRANT  
REVOKE

# CCL

Cursor Control Language are used to define cursors, prepare SQL commands.

DECLARE/OPEN/CLOSE CURSOR

EXPLAIN

FETCH

PREPARE

EXECUTE

DESCRIBE

# To mention

- Rows are not sorted, order of data is absent;
- Columns are named and have numbers / order;
- Datatypes: INTEGER/DECIMAL, CHAR/VARCHAR;
- Datatypes: DATA/DATE/TIME/DATETIME/MONEY/BINARY и т.д.;
- USER;
- End of query «;»;
- Text and values «'»/«"».

# Definitions

Keywords: SELECT, INSERT

Variables: sname, city, a > b

Required(<>): <field>

Optional([]): [WHERE <condition>]

Complex content ({}): {field definition}

Choice, one from a list (|): \*|<field>

# Create a table

```
CREATE TABLE <tablename>(
{field definition}
[, {field definition}]
[,...]
[, {field constraints}]
[,...]
);
```

field definition

```
<field name> <datatype>[(size)] [field constraints] [DEFAULT
<value>]
```

# Create a table

## Field constraints

NOT NULL | NULL — field cannot/can has NULL-values

PRIMARY KEY — field is a primary key

REFERENCES <table name> (<field name>) - field is a foreign key for specified field in another table

## Table constrains

PRIMARY KEY (<field name>[,<field name>][,...])

FOREING KEY (<field name>[,<field name>][,...]) REFERENCES <table name> (<field name>[,<field name>][,...])

# Add data

```
INSERT INTO <table name>[(<field name>[,...])]  
VALUES(<value>[,...]);
```

# Getting data

```
SELECT field1, field2 FROM table1;  
SELECT field2, field1 FROM table1;
```

```
SELECT name, salary*2 FROM persons;
```

```
SELECT 'FIO',name,'SALARY:',salary FROM persons;
```

# Delete data

```
DELETE FROM <table name> [WHERE <condition>];
```

# Getting data

```
SELECT *|<field name>[,<field name> ...]  
FROM <table name>  
[WHERE <condition>]  
[ORDER BY <field name>|<field number>[,...]];
```

```
SELECT fio FROM students;
```

```
SELECT * FROM students WHERE age < 18;
```

# Conditions

WHERE {condition} [<boolean operator> {condition}] [...]

[<argument1>] <operator> <argument2>

# Relational operators

$\equiv$   
 $\vee$   
 $\wedge$   
 $\forall \equiv$   
 $\exists \equiv$   
 $\diamond$

# Boolean operators

<argument1> AND <argument2>

<argument1> OR <argument2>

NOT <argument1>

# IN, BETWEEN

Operator **IN** defines set of values to check field value.

<field name> IN (<value>[,...])

Operator **BETWEEN** looks like **IN**. The difference in values. **IN** defines set of values but **BETWEEN** defines range of values.

<field name> BETWEEN <minimum> AND <maximum>

# LIKE

LIKE can be use only with CHAR or VARCHAR to find substrings. In condition we can use wildcards — special symbols.

<field name> LIKE <substring>

There are two symbols for wildcards in LIKE:

- Under stroke ( \_ ) to replace one character. For example, 'b\_t' will be equal to 'bat' or 'bit' but will not equal 'brat'.
- Percent (%) replaces sequence of any length of characters.

Example, '%p%t' will be equal to 'put', 'posit', or 'opt' but no 'spite'.

# NULL-values

IS [NOT] NULL

SELECT \* FROM students WHERE age IS NULL

SELECT \* FROM students WHERE age IS NOT NULL

SELECT \* FROM students WHERE age NOT IN (18,19)

SELECT \* FROM students WHERE NOT age IN (18,19)

# Aggregate functions

COUNT(\*|[DISTINCT|ALL] <field name>)

SUM([DISTINCT|ALL] <field name>|<expression>)

AVG([DISTINCT|ALL] <field name>|<expression>)

MAX([DISTINCT|ALL] <field name>|<expression>)

MIN([DISTINCT|ALL] <field name>|<expression>)

# Aggregate functions

```
SELECT COUNT(*) FROM students;
```

```
SELECT COUNT(DISTINCT fio) FROM students;
```

```
SELECT MAX(age) FROM students;
```

```
SELECT MIN(age) FROM students;
```

```
SELECT AVG(age) FROM students;
```

```
SELECT MIN(price*0.5) FROM goods;
```

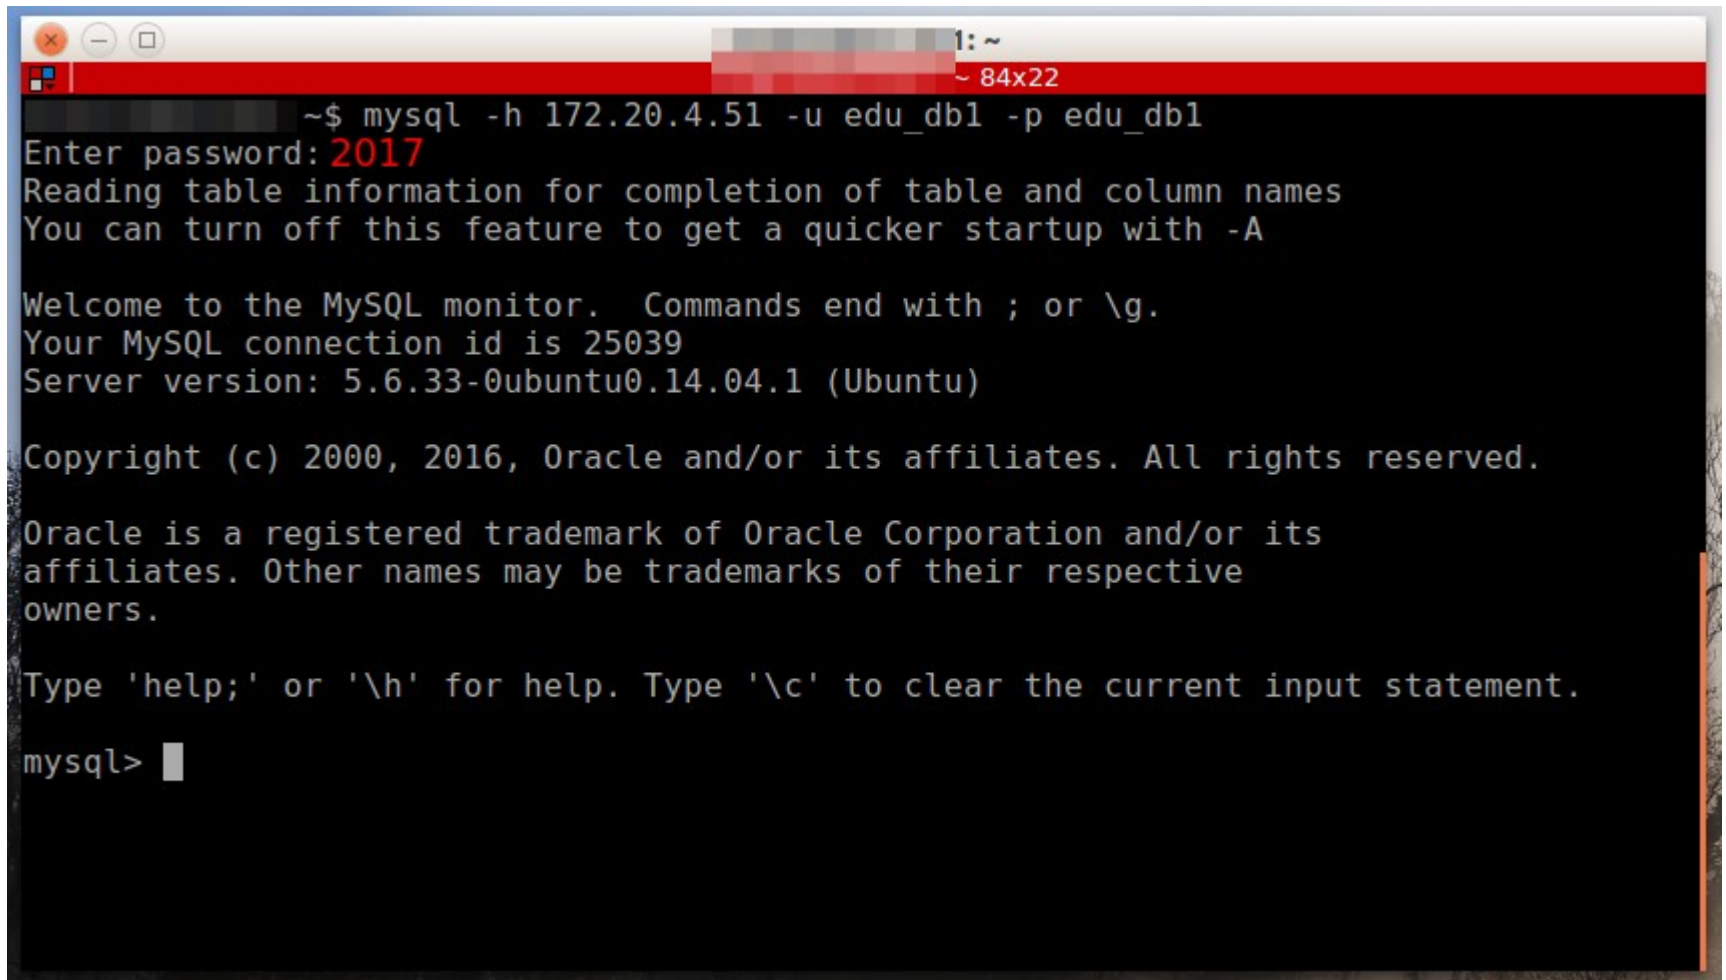

# Group

GROUP BY <field name>  
HAVING <condition>

SELECT {set of fields}, <aggregate function>[, ...]  
FROM <table name>  
GROUP BY {set of fields}  
[HAVING {condition}]

# Additional info

- press Ctrl+Alt+T in Linux

A terminal window with a red title bar and standard Linux window controls. The terminal shows the execution of the MySQL command-line client. The user has entered the command 'mysql -h 172.20.4.51 -u edu\_db1 -p edu\_db1'. The prompt 'Enter password:' is followed by the input '2017'. The terminal then displays the MySQL startup sequence, including the welcome message, connection ID (25039), server version (5.6.33-0ubuntu0.14.04.1), and copyright information. The prompt 'mysql>' is visible at the bottom of the terminal.

```
~$ mysql -h 172.20.4.51 -u edu_db1 -p edu_db1
Enter password: 2017
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 25039
Server version: 5.6.33-0ubuntu0.14.04.1 (Ubuntu)

owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql> █
```

# Task 1

- 1) Make a new table **edu\_test** with three fields: tnum (for a test number), tdate (for a event date), tres (for a test result)
- 2) Use command **SHOW TABLES** to see list of tables
- 3) Insert a record into **edu\_test**
- 4) See records from **edu\_test**
- 5) Disconnect from databse
- 6) Connect to database
- 7) See records from **edu\_test**
- 8) Destroy this table **edu\_test**
- 9) See records from **edu\_test**
- 10) Use command **SHOW TABLES** to see list of tables

# Task 2

- 1) Put a record with information about a saler: city - San Jose, name — Bianco, comm — NULL, snum — 1100
- 2) Delete all Clemens orders
- 3) Increase rating for all customers from Rome by 100
- 4) Get all orders with amount more than \$1,000
- 5) Get fields sname and city for all salers from London with commission more than .10
- 6) Summarize all amount for 03/10/2016
- 7) Calculate different customer's cities (do not calculate underfined)

# Task 3

- 1) Get orders with minimal amount for every customers
- 2) Get all customers with name which starts with letter **G**
- 3) Find out maximal rating in every city
- 4) Get orders with number of order, saler's number, commission for the saler (let's pretend it's 12%)
- 5) Find highest rating in every city. Output must be like  
*For the city **city** the highest rating is: **rating***
- 6) Get list of customers in descendant order for names
